# METHODS AND APPARATUS FOR ACCESSING DOCUMENT CONTENT

## ABSTRACT OF THE DISCLOSURE

5

Mechanisms and techniques provide a system for accessing documents using a graphical user interface. The system can be employed in a web browser like software application. In operation, the system accesses document properties for a document. The document properties can indicate a size of the document, an age of the document, and a

10   time associated with the document. The system can render a document selection display that provides a document identifier associated with the document. The document identifier can be render within a correlation framework that provides a visual correlation between values of document properties such as the size of the document, the age of the document, and a retrieval time associated with the document. The system can receive a

15   user document selection associated with the document identifier indicating that a user desires to obtain the document associated with the document identifier. The system can then retrieving and display the document associated with the document identifier on the graphical user interface.
